PREFACE

This report was prepared by SCS Consulting Engineers, Inc., Long Beach, California 90807. This Hazardous Waste inventory and Disposal Assessment was initiated by the Air Force to meet the requirements of the Resource Conservation and Recovery act of 1976 as amended in 40 CFR 261 & 264 May 19, 1980, and the California Administrative Code, title 22 Division 4. The report will be used as a reference document to the 1978 Space Shuttle Supplement 1. It will also be used for hazardous waste reporting to EPA/California, for hazardous waste management planning, and for engineering design concepts for the STS.

The report is in three volumes. Volume I is an inventory of hazardous wastes likely to be generated by the West Coast STS project. Volume II is an analysis of recycle, treatment, and disposal options for managing the projected STS Wastes. Volume III is an appendix with reference material for Volume II.

This work was accomplished between September 1980 and June 1981. Mr. John R. Edwards, Headquarters Space Division was the Project Officer.

This report has been reviewed by the office of Public Affairs (PA) and is releasable to the National Technical Information Service (NTIS). At the NTIS it will be available to the general public, including foreign nations.

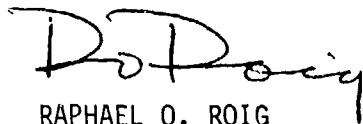

This report has been reviewed and is approved for publication.

20. ABSTRACT (Continue on reverse side if necessary and identify by block number) The Space Shuttle Program (STS) at Vandenberg Air Force Base is expected to generate a variety of hazardous wastes during its years of operation, from 1985 through 1990. The purpose of this study was to compile a projected inventory of the types and quantities of hazardous waste likely to be generated by shuttle-related ground operations. This inventory will be used to assess waste management options, to complete EPA hazardous waste forms, and for preparing the supplement to the Environmental Impact Statement.			

20. (continued)

The inventory lists waste types; chemical constituents; baseline and contingency mass and volume per launch, for each year of the project, and per month for each year; EPA and California hazardous waste numbers and hazardous properties; and California compatibility class.

Total baseline waste generation for the STS project is anticipated to be 130 million kg. The greatest quantities of wastes are expected to be generated by Station Sets V23 and V32 (72 million kg and 54 million kg, respectively). Estimated total project waste generated under contingency conditions is 1.4 million kg. The only station sets identified as potential generators of contingency wastes are V19, V21, and V23. Station Set V23 is expected to generate approximately 84 percent by weight of all contingency wastes.

99.6 percent by weight of all hazardous waste will be in liquid form, principally originating from flame bucket quenching (55.9 percent) and SRB washing and rinsing (41.9 percent). The remaining 0.4 percent by weight of all hazardous waste is expected to be in solid state. Most solid waste will be generated by Station Sets V31 and V32.

Further breakdown of wastes into hazardous and acutely hazardous categories reveals that only 1.8 percent by weight of total hazardous waste is expected to exhibit acutely hazardous properties. Primary generators of acutely hazardous waste will be Station Sets V19, V23; V21, and V17.

SECTION 1

EXECUTIVE SUMMARY

1. INTRODUCTION

The space shuttle program at Vandenberg Air Force Base is expected to generate a variety of hazardous wastes during its years of operation, from 1985 to 1994. The purpose of this report is to present an inventory of the expected types and quantities of waste to be generated by shuttle-related ground operations. The inventory provides estimates for:

- Types of wastes generated.
- Chemical constituents in each waste stream.
- Mass and/or volume of waste generated during scheduled ground operations (per launch cycle, per month per year, and project total).
- Mass and/or volume of waste generated under contingency conditions (per contingency event, per year, and project total).
- EPA and California hazardous waste numbers for each waste.
- EPA and California hazardous properties for each waste.
- California compatibility class for each waste.

The inventory will be used to assess waste management options (Volume II of this report), to complete EPA hazardous waste forms, and for preparing the supplement to the Environmental Impact Statement required for the Space Transportation System (STS) project.

2. HAZARDOUS WASTE REGULATIONS FOR GENERATORS

The U.S. Environmental Protection Agency (EPA) has developed a nationwide program to regulate hazardous wastes from generation to final disposal, through directives in the Resource Conservation and Recovery Act (RCRA) of 1976 (PL94-580). Under RCRA rules, Vandenberg Air Force Base (VAFB) is considered a generator of hazardous waste, and depending on its final waste management

plan, may also be considered as a storage, treatment, and/or disposal facility.

Regulations for generation of hazardous wastes are discussed in Volume I of this report. The primary responsibilities of the generator include:

- Identifying all hazardous wastes generated by the base and its tenants.
- Notifying EPA of hazardous activities within 90 days from the time that waste-generating activities commence.
- Obtaining an EPA generator's identification number.
- Preparing a hazardous waste manifest (in California, the California Hazardous Waste Manifest must be used).
- Properly containerizing and labeling waste and placarding transport vehicles.
- Reporting to California Department of Health Services:
 - Monthly (copies of manifests from the previous month)
 - Annually (submittal of completed EPA Annual Report Forms 8700-13 and 8700-13a).

Other requirements for generators include obtaining special permits for each shipment of extremely or acutely hazardous waste; and obtaining a permit if waste is to be stored by the generator for more than 60 days.

It is anticipated that by April 1981, California will receive interim authorization to administer its own hazardous waste program. At that time, the generator will be subject to all rules under California Administrative Code, Title 22. Until California receives final authorization, the generator must also comply with federal regulations authorized under RCRA.

3. SOURCES OF WASTE

A summary of the hazardous wastes generated over the duration of the STS project at VAFB is given in Tables 1, 2, and 3, monthly, yearly, and total project quantities, respectively, are reported for normal operations and contingency conditions.

TABLE 1. SUMMARY OF BASELINE MONTHLY HAZARDOUS WASTE GENERATION, 1985 - 1994

Monthly for 1985		Monthly for 1986		Monthly for 1987		Monthly for 1988-1994	
Kilograms	Pounds	Kilograms	Pounds	Kilograms	Pounds	Kilograms	Pounds
346,656.8	764,251.5	519,985.3	1,146,377.5	866,642.5	1,910,629.8	1,299,963.8	2,865,944.5

TABLE 2. SUMMARY OF BASELINE YEARLY HAZARDOUS WASTE GENERATION, 1985-1994

1985		1986		1987		Yearly for 1988-1994		Project Total	
Kilograms	Pounds	Kilograms	Pounds	Kilograms	Pounds	Kilograms	Pounds	Kilograms	Pounds
4,159,882.0	9,171,018.0	6,239,824.0	13,756,530.0	10,399,710.0	22,927,556.0	15,599,566.0	34,391,336.0	129,996,350.0	286,594,408.0

TABLE 3. SUMMARY OF CONTINGENCY HAZARDOUS WASTE GENERATION, 1985-1994

1985		1986		1987		Yearly for 1988-1994		Project Total	
Kilograms	Pounds	Kilograms	Pounds	Kilograms	Pounds	Kilograms	Pounds	Kilograms	Pounds
121,367.7	267,571.5	124,633.5	274,771.5	131,165.2	289,171.5	139,329.8	307,171.5	1,352,475.0	2,981,715.0

As shown in Table 2, total baseline waste generation for the STS project is anticipated to be 130 million kg (287 million lbs). Annual waste generation is estimated to range from 4.2 million kg/yr (9.2 million lbs/yr) for 1985, to 15.6 million kg/yr (34.5 million lbs/yr) for each of the years 1988 through 1994. This increase reflects changes in the number of launches per year from 4 to 15. Baseline waste generation for each year of the project is graphically represented in Figure 1.

Figure 1. Baseline quantities of hazardous waste generated by STS ground operations at VAFB (reported for each year for the period 1985 through 1994).

The greatest quantities of wastes are expected to be generated by V23 (72 million kg; 160 million lbs for total project), followed by Station Set V32 (54 million kg; 120 million lbs for total project). This accounts for 97.5 percent by weight of all baseline hazardous waste generation. The combined waste generated by all other Station Sets is projected to be 2.5 orders of magnitude less by weight than waste generation at V23 and V32.

Expressed as percentages by weight (Figure 2), Station Set V23 is projected to generate 55.7 percent of the total under normal operating conditions; V32 approximately 41.8 percent; and V19 and V31, less than 1 percent each. The balance of these wastes (i.e., 0.9 percent) will be generated mainly by Station Sets V17 and V21.

Figure 2. Baseline quantities of hazardous waste generated by STS ground operations at VAFB (reported by station set).

According to Table 3, estimated total project waste generated under contingency conditions is 1.4 million kg (3.0 million lbs). The only station sets identified to date as potential generators of contingency wastes are V19, V21, and V23 (Figure 3). Station set V23 will produce approximately 84 percent by weight of all contingency waste.

Investigations into the physical state of the hazardous wastes generated during normal operations indicate that the majority of wastes are in a liquid state (Figure 4a). Major sources of liquid hazardous wastes, as shown in Figure 4c, are expected to be produced during normal ground operations at Station Sets V23 (55.9 percent) and V32 (41.9 percent). Other station sets each produce less than 1 percent of total liquid wastes. In summary, 99.6 percent by weight (1.0 million kg; 2.3 million lbs) of all the hazardous wastes will be in a liquid form (Figure 4a). This translates to 92.7 percent on a volumetric basis.

Figure 3. Contingency waste generated by STS ground operations at VAFB (Station Sets V19, V21 and V23).

Figure 4. Physical state of hazardous waste generated by STS ground operations at VAFB under baseline conditions (reported by station set).

Only 0.4 percent by weight (7.3 percent by volume) of all hazardous wastes are expected to be in a solid state (Figure 4a). Most solid waste will be produced by Station Set V31 (71.5 percent) and Station Set V32 (19.1 percent) as shown in Figure 4b. Solid waste generation by all other station sets is less than 10 percent of total solids.

4. MAJOR TYPES OF WASTES GENERATED

Waste categories generated in the largest quantities are expected to be:

- Quench water (QW).
- SRB wash water (SB).
- Insulation wastewater (or "suprawater") (IW).
- SRB initial rinse (SI).
- Contaminated seawater (CS).
- Nonaqueous solvent wastes (SO).
- EEW&S wastewater (EW).
- Fuel spill cleanup wastes (FS).
- Hydrazine scrubber effluent (HS).

These wastes are estimated to constitute 99.4 percent by weight of total waste generation (129 million kg; 284 million lbs). The QW is projected to be the most predominant waste type,

followed by SB and IW wastes. As shown in Figure 5a, these three waste types constitute 54.6, 20.4, and 17.8 percent by weight, respectively, of the total quantity of wastes generated by the major waste categories. Other major waste categories produce 7.2 percent of the total waste. The remaining 0.6 percent of waste is associated with the following minor categories (Figure 5b):

- Adhesive wastes (AW).
- Batteries (BA).
- Contaminated air filters (CA).
- Catalytic bed wash water (CB).
- Containers (CN).
- Contaminated rags (CR).
- Hydraulic fluids (HF).
- Hydrazine (HY).
- Insulation wastes, solid (IN).
- Monomethyl hydrazine (MH).
- Ammonia or ammonia wastewater (NH).
- Nitrogen tetroxide (NO).
- Oxidizer spill cleanup (OS).
- Paint wastes (PA).
- Paint wastewaters (PW).
- Solvent reducer wastes (SR).
- Solvent wastewaters (SW).
- Worn-out parts (WP).

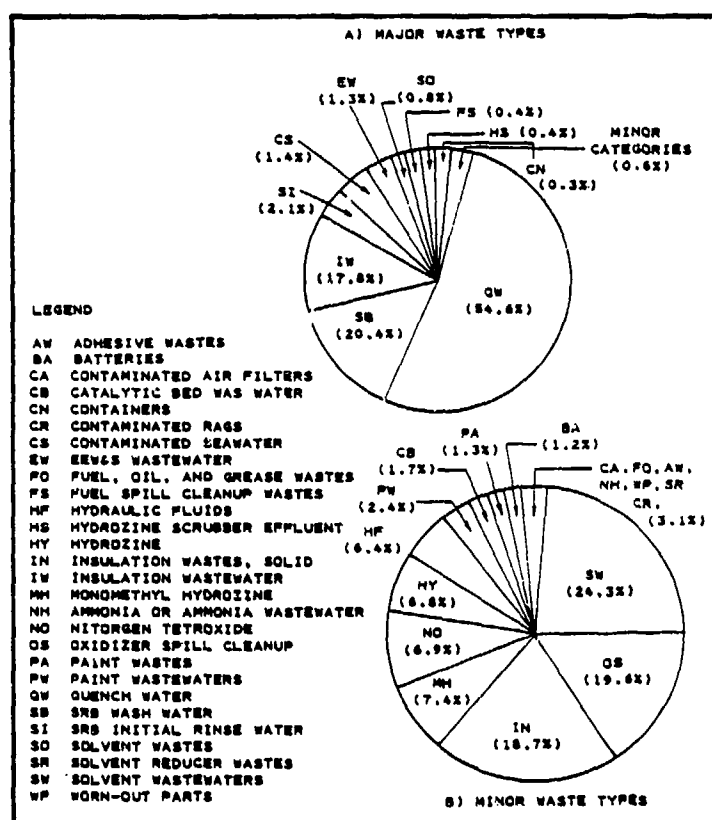

Figure 5. Hazardous waste generated under baseline conditions, by waste type.

The first three minor categories are expected to jointly contribute over 60 percent by weight to the 0.6 percent of minor wastes.

5. HAZARDOUS AND ACUTELY HAZARDOUS WASTES

Further breakdown of wastes into hazardous and acutely hazardous categories reveals that only 1.8 percent by weight of total hazardous wastes are expected to exhibit acutely hazardous properties (Figure 6a). Primary generators of acutely hazardous waste will be Station Sets V19 (37.0 percent), V23 (25.8 percent), V21 (18.2 percent), and V17 (14.9 percent) (Figure 6b). The remaining 4.1 percent is expected to be generated by Station Sets V31 and V32 (3.3 and 0.8 percent, respectively) (Figure 15b). As shown in Figure 7, most of the hazardous wastes generated by Station Sets V17, V19 and V21 are expected to exhibit acutely hazardous properties.

Figure 6. Hazardous and acutely hazardous waste generation under baseline conditions.

Figure 7. Comparison of hazardous and acutely hazardous waste generation under baseline conditions (reported by station set on a per launch basis).

Generation rates for hazardous and acutely hazardous wastes are provided in Tables 4 and 5. Total projected baseline quantities of hazardous and acutely hazardous waste per launch are 1.0 million kg (2.2 million lb) and 0.02 million kg (0.04 million lb), respectively (Table 4). Consequently, the projected cumulative generation of these wastes for the period 1985 through 1994 is expected to be 128 million kg (282 million lb) and 2.3 million kg (5.1 million lb), respectively (Table 5).

TABLE 4. SUMMARY OF HAZARDOUS AND ACUTELY HAZARDOUS WASTE GENERATION PER MONTH, 1985-1994

	Per Launch		1985 Monthly		1986 Monthly		1987 Monthly		1988-1994 Monthly

SECTION 2

FEDERAL AND STATE REGULATIONS FOR HAZARDOUS WASTE GENERATORS

The U.S. Environmental Protection Agency (EPA) has developed a nationwide program to regulate hazardous wastes from generation to final disposal, through directives in the Resource Conservation and Recovery Act (RCRA) of 1976 (PL94-580). These regulations are not industry-specific; all industries, including Department of Defense (DOD) facilities, which generate, store, transport, treat, or dispose of hazardous wastes, are affected by RCRA and must comply with the same set of rules. Vandenberg Air Force Base (VAFB) is considered a generator of hazardous waste, and, depending on its final waste management plan, may also be considered as a storage, treatment, and/or disposal facility.

This section provides a comparison between federal (RCRA) and California (Title 22) hazardous waste regulations. Responsibilities of the hazardous waste generator are also discussed, and include RCRA requirements as well as additional requirements imposed by Title 22. Requirements for transporters and for owners and operators of storage, treatment, and disposal facilities are presented in Volume II. It is important to note that the requirements discussed in this report reflect regulations on the record as of December 1980. Many changes in both state and federal hazardous waste regulations are anticipated for 1981.

The major provisions under RCRA for controlling hazardous wastes are:

- 40 CFR Part 260: Definitions used in other parts corresponding to Sections 3001 through 3004 RCRA rules, and general provisions applicable to these parts (FR date 5/19/80, Part II).
- 40 CFR Part 261: Section 3001: Identification and listing of hazardous waste (FR date 5/19/80, Part III).
- 40 CFR Part 262: Section 3002: Standards applicable to generators of hazardous waste, including manifest system, recordkeeping, and reporting (FR date 5/19/80, Part V).
- 40 CFR Part 263: Section 3003: Standards applicable to transporters of hazardous waste, including manifest system, recordkeeping, and reporting (FR date 5/19/80, Part VI).

- 40 CFR Part 264: Section 3004: Standards applicable to owners and operators of hazardous waste treatment, storage, and disposal facilities, including manifest system, recordkeeping, and reporting (FR date 5/19/80, Part VII).
- 40 CFR Part 265: Section 3004: Interim status standards applicable to owners and operators of hazardous waste treatment, storage, and disposal facilities (FR date 5/19/80, Part VII).
- 40 CFR Parts 122 and 124: Section 3005: Permits for treatment, storage, and disposal of hazardous waste (FR date 5/19/80, Part X).
- 40 CFR Part 123: Section 3006: Guidelines for authorized state hazardous waste programs (FR date 5/19/80, Part X).
- Section 3010: Preliminary notification of hazardous waste activity (FR date 2/26/80).

Section 3006 of RCRA provides for individual states to operate their own hazardous waste programs (HWP) in lieu of the federal program. Title 40 CFR, Part 123, establishes minimum requirements which state HWP's must meet in order to receive EPA approval. The State of California Department of Health Services (CDHS) and the State Water Resources Control Board have applied for interim authorization (Phase I) to administer a state HWP. It is anticipated that interim authorization will be granted by April 1981. With interim authorization, California can operate its own HWP for 2 years after the effective date of the federal regulations. Final or full authorization will be granted if California's HWP is determined by EPA to be equivalent to and consistent with the federal program. The California HWP could be fully authorized by the November 1983 deadline, 2 years prior to the first space shuttle launch at VAFB. For the present, California waste generators must meet both current California Title 22 and RCRA standards (by the time California is granted full authorization, all applicable RCRA regulations will have been incorporated into Title 22). DOD facilities operating in California must, by executive order, comply with all California laws. Milestone events for implementing the California HWP are as follows (5):

- 1981 Program interim authorization will be received; electronic data processing system will be operational; statewide surveys of hazardous waste production will be completed.
- 1981 Hazardous waste recycling clearinghouse will match waste producers with potential markets for wastes; technical information center will provide rapid response to emergencies, and provide information

about waste characteristics, treatment, methods, etc.

1982 Full staff will be "on board," and the state HWP plan will be completed.

1983 All qualified hazardous waste facilities will be under permit.

Although federal requirements will not preempt California law, they will impose a second layer of control on California generators and handlers of hazardous waste who must comply with the most restrictive standard, whether federal or state. For example, states may not preempt federal regulations by imposing any requirement that might interfere with the free movement of hazardous wastes across state boundaries to treatment, storage, or disposal facilities holding an RCRA permit. An outline comparing the fundamental differences between EPA and CDHS regulations for generators of hazardous wastes is presented in Table 6.

Responsibilities of Generators

In order to comply with both EPA and California regulations, a California generator will have the following duties and obligations:

Identifying Hazardous Wastes--It must first be determined if a waste meets the hazardous waste criteria as defined in the RCRA (40 CFR 261) and/or the California Administrative Code (CAC), Title 22. Any solid waste (see glossary definition of a solid waste) is considered hazardous if it is flammable, corrosive, toxic, reactive, irritating, a strong sensitizer, or exhibits EP toxicity. The definitions of these hazardous characteristics are found in 40 CFR 261, Subpart C, and in CAC Title 22. A detailed explanation of these characteristics is found in Appendices B and C. Federal regulations also identify specific wastes considered to be acutely hazardous (40 CFR 261, Subpart D). Similar, but not identical, to the EPA listing are the extremely hazardous wastes identified in CAC Title 22. Eventually, the California rules will include all of EPA's listed wastes, and perhaps additional wastes which the state considers hazardous. For the present, all wastes listed by EPA and the State of California must be manifested. However, EPA annual reports require only EPA-listed wastes.

If a waste is unlisted, a generator may choose to test the suspected waste to determine whether or not it is hazardous, or may declare the waste to be hazardous without testing, based on a knowledge of its hazardous properties (45 FR 262.11). Test protocols are published in Test Methods for Evaluating Solid Waste, USEPA Office of Water and Waste Management, SW-846, 1980.

Small-Quantity Generator Exceptions--Under the EPA regulations, small waste generators (i.e., <1,000 kg/mo hazardous

TABLE 6. COMPARISON OF FEDERAL AND CALIFORNIA REGULATIONS FOR GENERATORS OF HAZARDOUS WASTES SHIPPING TO AN OFF-SITE TREATMENT, STORAGE, OR DISPOSAL FACILITY (41)

Federal	State
Determine if waste is hazardous as defined in 40 CRF, Part 261.	Determine if waste is hazardous as defined in Cal. Ad., Title 22, Div. 4.
Obtain EPA Identification Number (ID#).	--
Obtain EPA Facility Permit if waste has accumulated on generators property for more than 90 days.	Obtain Facilities Permit from CDHS if waste has been stored on property for more than 60 days.
Use proper containers and label properly.	Same
Prepare EPA-specified transport manifest (California Liquid Waste Haulers Manifest permissible for use during interim period).	Must use California Liquid Waste Haulers Manifest (EPA data will be included in future); manifest will eventually be consistent with EPA requirements.
Ship hazardous waste only by a transporter with an EPA identification number.	Ship hazardous waste <u>only</u> with a transporter permitted by CDHS.
Make sure that waste arrives at designated facility.	Same
Submit annual summary of waste disposal activities (Annual Report) and file 45-day Exception Reports for missing manifests to EPA Regional Administrator.	Send copies of all Hazardous Waste Manifests to CDHS every 30 days. Must also report to EPA Region IX annually and make 45-day Exception Reports for missing manifests.
Must keep manifests, annual reports, exception reports, and test results for a period of 3 years.	Reports on hazardous waste activities must be kept for a period of not less than 1 year.

waste; <1 kg/mo acutely hazardous waste) are exempt from record-keeping/manifest requirements (45 FR 261.5). California regulations are more stringent, allowing no exemptions. Even if the generator would qualify as a small generator under RCRA, no exemption would be allowed under California law. California does provide a variance for small quantities or low concentrations. Exact quantities and concentrations are not specified, but the general description states insignificance as a potential hazard to human health, domestic livestock, or wildlife. EPA plans to amend the small generator exceptions over the next 2 to 5 years, possibly reducing the present limit for hazardous wastes from 1,000 to 100 kg/mo. The limit for acutely hazardous waste is not expected to change.

Notification of Hazardous Activities--Within 90 days from the time that operations at the space shuttle facility commence, and before any waste can be transported, the generator will be required to notify the EPA Region IX Administrator and apply for an EPA identification number (45 FR, Part 262.12; 45 FR, Page 12746). If the generator also plans to own/operate facilities for treatment, storage, or disposal of hazardous waste, it may file a single form to cover all activities that occur on the base. There are stiff penalties for failing to notify EPA, including suspension of all operations.

Transportation of Hazardous Wastes--The generator has two options available if hazardous waste is to be transported off site. They may contract with a state-licensed commercial hauler, or transport waste themselves, in which case they must obtain an EPA Transporter's Identification Number (45 FR 263.11) and a California Registered Hazardous Waste Hauler's Permit (CAC Title 22). In addition, they must comply with all applicable EPA (40 CFR 263.11 and 263.31) and Department of Transportation (Hazardous Materials Transportation Act, 49 CFR Parts 171 through 179) regulations. A generator must insure that the hazardous waste is properly containerized and labeled, and that trucks are placarded in accordance with EPA (40 CFR Part 262.30) and DOT (49 CFR Parts 171 through 179) regulations controlling the transportation of hazardous materials.

Hazardous Waste Manifest--Before shipping any hazardous wastes, a generator must prepare the California Hazardous Waste Manifest. Figure 8 presents the new California Hazardous Waste Manifest, which has been developed to insure that California hazardous waste generators, transporters, and facility operators will be in conformance with both the requirements of the new federal hazardous waste regulations adopted pursuant to RCRA, and the requirements of state law. The new manifest will replace the current California Liquid Waste Hauler Record or hazardous waste manifest.

As has been the practice in the past, transporters are expected to print their own manifests. Each manifest will have a unique serial number, as described in Item 1 of "Instructions for

INSTRUCTIONS FOR COMPLETING MANIFEST

Conclusion

- Item 1.** Before filing out the mandates, a unique recipient serial number shall be written or printed on the mandates. Write in TRANSFORTER form 1 below.
- Item 2.** Provide the complete name, EPA ID number, address, and telephone numbers of the generator and designated TSD facility.
- Item 3.** Provide all US DOT required information. Refer to 49 CFR 172 for particulars. If not applicable enter "none" in Item 5.
- Item 4.** Provide the most applicable industrial waste category number from the following list. In cases where a waste could be described by more than one category, select the most specific. If no generator is aware of placing substance containing material, select the "category". Placing substance, "acid" rather than "Acid substance" or "Heavy metal solution". If none of the listed categories sufficiently described your waste, write the waste's chemical name, below.

- [illegible]

- [illegible]

TRANSFERS

- Provide the total number of the manifest. The last three digits shall be your State hazardous waste body number. The last six digits may be any convenient combination of digits to 9 (e.g., 000000). For example, if your manifest number is 123456789, then the manifest number should be 000 000000. The complete manifest number shall be stamped on the top left corner of the manifest. For example, if your manifest number is 123456789, then the manifest number should be stamped as 000 000000 upon entry June 1, 1986.

200 FACILITY OPERATIONS

- Item 17.** Provide the TSD facility name and EPA ID number.
If the name, address or owner is required or recommended by the TSD facility, so is requested, indicate the quantity
Item 18. If the waste is applied to the land (e.g., surface impoundment, landfill, injection well), or land treatment used, the State hazardous waste fee must be sent to DOWS. Indicate the fee as Item 19
Item 19. If the waste is different from the manifest information provided by the generator or transporter, and send forms when the shipment was delivered to the facility. If sample, add
Item 20. Write in any discrepancies noted between the manifest information submitted by the generator or transporter, and send forms when the shipment was delivered to the facility. If sample, add
Item 21. Check one box to indicate the method(s) used to handle or dispose of the waste at the hazardous waste facility. If the waste is treated prior to, or instead of, land disposal under the land
Item 22. If the waste is held at the TSD facility prior to eventual shipment, provide the name of the designated land TSD facility, and its EPA ID.
Item 23. In each case, you, the facility (transfer station operator), shall file a new master manifest containing your facility's name and describing all wastes in the shipment.
Item 24. Enclosed copies of all original manifests associated with the original waste shipments accepted by you shall be attached to the master manifest.
Item 25. Sign the manifest, provide your title within the organization and indicate the date that the shipment was accepted at your facility.
Item 26. The facility operator shall send a copy of the component manifest to the DOWS on a monthly basis or at otherwise required. If waste are received from transfer facilities, the land TSD facility shall send a copy of each master manifest to DOWS with copies of all original manifests applied to it.
Item 27. Under Facilities shall send only one set of copies to DOWS to verify the manifest submission requirements for generators and TSD facility operators

Distribution of Manifest Copies:

Copy Number 1 (original)	TSDF keeps (send photocopy to DQHS)
Copy Number 2	To Transpore after signed by TSDF
Copy Number 3	To Generator from TSDF
Copy Number 4	Generate keeps after signed by Transpore (send photocopy to DQHS)

TO INSURE LEGIBLE COPIES USE ONLY BLACK CARBON INSERTS OR BLACK PINK CARBONLESS TRANSFER PAPER.

Figure 8 (continued).

Completing Manifest" (see Figure 9). The instructions will be printed on the backs of each manifest and manifest copy. These instructions specify the requirements for using the manifest, for transferring waste, and for distributing manifest copies.

The new federal regulations, which became effective on November 19, 1980, require that certain information which was not previously required by California law now be provided on all hazardous waste manifests. That information includes the following:

- EPA I.D. number of the generator, transporter, and TSD (treatment, storage, and disposal) facilities.
- Hazardous materials descriptions as required by the U.S. Department of Transportation in 49 CFR.
- The name, address, and EPA I.D. of the TSD facility designated by the generator to receive the waste, and, if desired, an alternate facility.
- A generator's certification with the statement exactly as shown on the enclosed manifest.

The current Liquid Waste Hauler Record cannot be used after December 31, 1980. On January 1, 1981, the new manifest will be the only acceptable shipping document to accompany hazardous waste shipments in California. Questions regarding the new manifest or its use should be directed to one of the following Hazardous Materials Management Section offices:

Sacramento

Hazardous Materials Management Section
714 "P" Street
Sacramento, California 95814
(916) 322-2337

Berkeley

Hazardous Materials Management Section
2151 Berkeley Way, Room 140
Berkeley, California 94704
(415) 540-2043

Los Angeles

Hazardous Materials Management Section
107 S. Broadway, Room 7012
Los Angeles, California 90012
(213) 620-2380

After completing the manifest and transferring the waste to the transporter, a designated person representing the generator signs the certification on the original manifest and all copies

[illegible][illegible]

Figure 9. EPA forms 8700-13 and 8700-13a.

(one for each person handling the waste). The transporter then signs and dates the manifest and returns one copy to the generator, who retains it until a copy is received from the designated permitted facility following delivery of the waste. A generator is required to initiate a trace if it does not receive a copy of the manifest from the disposal facility within 35 days after the waste has been shipped. All contacts made while tracing a delinquent manifest should be well documented. If the manifest has not been received within 45 days after shipment, the generator must report the incident to CDHS at (916) 322-2337. Supporting documentation may be required.

Reporting Requirements for Generators--The generator will be required to send copies of all manifests from the previous month to California Department of Health Services, Hazardous Materials Management Branch, 744 P Street, Sacramento, California 95814. In addition, federal regulations require an annual report from generators who ship hazardous waste off site (45 FR 262, Subpart D). The Annual Report is made on EPA Forms 8700-13 and 8700-13a (Figure 9), and sent to CDHS in Sacramento. (If, however, a generator decides to treat, store, or dispose of wastes on base, it must submit an Annual Report covering those wastes in accordance with the provisions of 40 CFR Parts 264, 265, and 266, and with 40 CFR Part 122. In addition to following requirements, generators must comply with reporting requirements for TSD facilities, and should make provisions to hold all records, manifests, and reports for 3 years.

Manifest requirements are somewhat different for rail shipment or bulk shipment of hazardous wastes by water. The generator should consult the regulations if such means are used to transport wastes to permitted handling facilities (45 FR 263, Subpart B).

Disposal of Extremely Hazardous Waste by Generators--Some of the wastes generated by the STS (e.g., monomethyl hydrazine) are defined as extremely hazardous (CAC Sections 66064 and 66680 to 66685). No extremely hazardous waste shall be handled or disposed of in California without an Extremely Hazardous Waste Disposal Permit issued by the state. The generator must apply for this permit at least 15 days prior to the intended date of disposal. It can be expected that TSD facilities will require generators to make arrangements prior to shipment of these special wastes to their sites. Unexpected shipments will be returned at the generator's expense.

Storage Treatment and Disposal of Hazardous Wastes by Generators--If a generator stores hazardous wastes on site for more than 60 days (the 90-day limit set by EPA is preempted by California law), or treats or disposes of hazardous wastes on site, they must apply for and receive a Hazardous Waste Facility Permit, and comply with all applicable regulations (45 FR 264, Subpart A).

An inventory of projected hazardous waste to be generated by the STS is presented in Section 3 of this report. Included with the inventory are many of the items required for the EPA Annual Report, such as hazardous waste identification numbers and waste characteristics. The following section describes the methodology and assumptions used in developing the inventory.

SECTION 3

METHODOLOGY AND ASSUMPTIONS

As of the date of the compilation of this inventory, there have been no space shuttle launches or landings, either at VAFB or KSC. Consequently, operational data regarding waste generation are not yet available. Waste types and quantities must be estimated based on design specifications and projections of materials used. In many cases, these estimates can be related to similar operations, such as aircraft maintenance and conventional rocket launches.

In compiling this inventory, SCS made as much use as possible of existing documentation relating to the proposed space shuttle operation at VAFB. This documentation is listed in the bibliography. In general, the most relevant documents were those concerned with occupational safety and air emissions, since both of these address chemical types and quantities. However, because their inherent purpose differs appreciably from the compilation of a hazardous waste inventory, many and often sizeable data gaps exist.

An attempt was made to bridge these gaps and to complete the data base through direct contact with contractors and Air Force personnel involved in the design of the space shuttle, and related ground operations, facilities, and procedures. Ultimately, a number of questions remain regarding quantities of waste generated and waste forms. Consequently, a number of assumptions and simplifications were necessary to make this inventory as complete as possible. These assumptions and simplifications are detailed below. There are still several areas of uncertainty, however, and in the inventory which follows, a number of wastes are listed without quantity data. This means that a potential hazardous waste was identified, but insufficient information was available at the time of this inventory to produce a reasonable estimate of quantities per launch cycle.

In addition, there were other potentially hazardous wastes identified which are not included in the inventory, i.e., orbiter self-destruct ordnance (SDO) and potential pollution control wastes. It has been established that SDO waste will be generated whenever the orbiter and SRB are deactivated. This waste is hazardous (reactive) under EPA regulatory definitions. However, there are existing military ordnance handling and disposal practices which may be applicable to the shuttle program, and there is an existing ordnance disposal facility at Pt. Mugu. Pollution

control wastes, other than those identified in the baseline inventory, would have to be considered contingency wastes. In particular, SCS believes it likely that some or all of the solvent vapor emissions projected to be vented may come under new regulatory restraints before or during the course of the shuttle program. If this does in fact occur, additional solvent and air pollution control wastes will be generated. The Air Force is aware of this potential. Detailed information on these and other toxic and hazardous STS-related air emissions is available in the Air Force air emissions inventory (23).

VAFB station sets group the various Shuttle Transport System ground operations processing activities into geographic and functional categories. A geographic station set is a site-specific accumulation of equipment, facilities, hardware, and related resources that constitutes a definitive phase of the ground operations. A functional station set is an aggregate of equipment and services, not limited to or readily identified by location, that provides or supports specific functions of system operations.

The inventory prepared for this draft report includes projections of hazardous wastes for eight geographical station sets (i.e., V18, V19, V21, V23, V31, V32, and V33). The potential for hazardous waste generation at Station Sets V27, V28, V30, V81, V84, V86, and V88 cannot be verified at this time. It is considered that these station sets either (1) generate no hazardous waste under baseline conditions, or (2) generate small quantities of hazardous waste which cannot be quantified based on available information.

Assumptions and simplifications were needed to both identify and quantify some of the hazardous waste streams. There are several general types of assumptions and simplifications that have affected the inventory compilation throughout. These are listed below.

- Except where specified in existing STS/VAFB documents, it is assumed that there will be no reclamation or reuse of excess or waste products. This includes excess paint mixtures, used rags, protective clothing (except SCAPE suits), excess hypergols or hypergols removed from the orbiter after an abort or acquisition screen test, and process waters.
- STS data on procedures, materials, and quantities were used wherever they existed. If no STS data were available, an attempt was made to identify relevant KSC data.
- It is assumed that all materials which are not hazardous in and of themselves, but which come into contact with hazardous materials during use, become hazardous wastes when discarded. These include empty containers, rags, protective clothing, worn-out parts, process waters, etc.

This is in accordance with the RCRA hazardous waste regulations.

- Where the chemical composition of a commercial product used during ground operations was unknown and could not be defined, the composition of similar commercial products was used to determine whether the product contained any listed hazardous materials.
- In the case where waste-producing operations are performed at a given station set under one set of conditions, and at another station set under different conditions, one of these station sets was arbitrarily selected as the waste generator. This was done to avoid duplicate accounting when the waste quantities were totalled. For instance, wastes from external tank closeout operations, which could occur at either V23 or V33, were assigned to the pseudo Station Set 99.
- When similar waste-producing operations were identified at several station sets or at several locations within a single station set, and qualitative/quantitative data were available for only one locale, comparable data (the same or a simple multiple) were used for all of the other locales where the operation could occur.
- Where waste generation data from the literature were given as a range, the high value in the range was taken for this inventory.
- Unless otherwise specified in the documents or through personal communications, it is assumed that 10 percent of all paint, insulation, ablator, etc., used during the ground operations will be wasted.
- In converting from volume to mass units (or vice versa) for mixtures of wastes with uncertain compositions, densities were estimated based upon similar waste types of known density or upon densities of the predominant component of the mix.

SECTION 4

HAZARDOUS WASTE INVENTORY

The operation of the Space Shuttle Program at VAFB in the late 1980's and early 1990's will produce significant volumes and varieties of hazardous materials. An inventory of these wastes is necessary to help comply with recent EPA hazardous waste generator regulations and to assess alternative treatment/disposal options. In addition, a portion of the inventory will be used to prepare a supplement to the final Environmental Impact Statement (EIS) for the program.

The intent of this inventory is to identify and quantify all potentially hazardous solid and liquid wastes likely to be generated at VAFB during the STS ground operations. The basic inventory was compiled on a per launch basis, from which annual, monthly, and total project waste generation was calculated. Values are reported in mass and volume units. Estimates of pollutant concentrations, where applicable, are provided in Volume II of this report. The information in the following tables can be used to estimate the quantities needed for EPA reports, and to provide a supplement to the final EIS. Additionally, these tables will form the basis for the Volume II assessment of treatment/disposal alternatives.

Table 7 is a list of the STS hazardous wastes arranged by station set. From left to right, this table shows:

- STA SET - the station set number. Note that Station Set V99 is a pseudo station set, referring to a combination of Station Sets V23 and V33 (see Section 3 for explanation). The wastes identified at V99 come from external tank closeout activities, which may occur at either V23 or V33.
- CAT - category code. This is a sorting tool for grouping wastes with similar characteristics (see Glossary).
- WASTE MATERIAL - descriptions of the projected hazardous wastes. These wastes may be individual chemicals, excess commercial formulations, or mixed wastes. Items which have been indented slightly in the tables represent the chemical constituents of mixed wastes or commercial products.

- SOL OR LIQ - solid or liquid; the projected physical state of the waste material.
- OPERATION - a brief description, where appropriate, of the particular operation producing the waste material.
- HAZ WST NO. EPA/CAL - EPA and California hazardous waste numbers. Both EPA and the State of California have issued lists of wastes that they consider to be hazardous. These are presented in 45 FR 33084-33133 (40 CFR 261) and CAC, Title 22, Division 4, Chapter 30, Article 9, respectively (see Appendices B and C). The EPA numbers will be needed to complete all of the EPA hazardous waste notification, application, and reporting forms required of all hazardous waste generators under RCRA.
- HAZ PROP. EPA/CAL - the hazardous properties of the wastes, according to EPA and California lists or definitions. This information is useful in determining waste compatibility and assessing treatment alternatives (see Glossary for the meanings of hazard codes).
- CAL COMP CLASS - California compatibility class. Special precautions are needed when managing or treating chemically incompatible wastes. The California Department of Health (Law, Regulations, and Guidelines for Handling of Hazardous Waste, February 1975) developed a set of 12 groups to generally classify incompatible hazardous waste. These incompatibility groups are also listed in 45 FR 33257-33258.

Table 8 is a listing of unit factors for generation of STS hazardous wastes. Unit factors are expressed on a per launch (baseline) and per event (contingency) basis. They are grouped alphabetically by category code for each station set. Mass and volume values are given in both metric and English units. Under the volume column (English units), liquid wastes are given in gallons, and solid wastes in cubic feet. Missing numbers indicate insufficient information to quantify a particular waste.

Baseline wastes are those which can be routinely expected during every launch cycle, and are thus expressed on a per launch basis. In some cases, a particular operation does not occur during every launch cycle, but does occur at regular, launch-related intervals. For these operations, the wastes generated are divided by the launch frequency of the operations, and are presented on an average per launch basis.

Contingency wastes are those which will be generated only sporadically from unplanned events. These include abortions, spills, special tests, etc. Contingency values are expressed as estimated quantities per event; event frequency is denoted in the table footnotes.

Table 8 is the basis for all of the tables which follow. It can be used to estimate annual, monthly, or total project hazardous waste emissions for any launch schedule. Tables 9 and 10 present the annual and average monthly hazardous waste generation for each year of the STS Program, from 1985 through 1994. Table 9 presents the data for 1985, representing 4 launches; Table 10, the data for 1986, representing 6 launches; Table 11, the data for 1987, with 10 launches; and Table 12, the monthly and annual data for the period 1988 through 1994, representing 15 launches. Only one table (Table 12) is used to show the wastes generated in 1988 to 1994, as each year is projected to have the same number (i.e., 15) of launches. In each of these tables, the average monthly generation is equal to the annual quantity divided by 12 months.

The hazardous wastes shown in Tables 9 through 12 are listed in the same order as they appear in Table 8. In these tables, only mass values are listed, and a missing number indicates an identified waste for which insufficient information was available to estimate quantities. Subtotals are presented for each category, and each year is totalled by station set.

A summary of the generation of hazardous wastes for the entire STS program is given in Table 13. Mass quantities of these wastes are presented alphabetically by category code for each station set. Both baseline and contingency quantities (monthly and annual) are given per station set. Subtotals for each station set are then added together, resulting in the total quantity of hazardous wastes generated by the STS program for the period 1985 through 1994. In addition, total quantities of all hazardous wastes are given for each category code.

FOOTNOTES

1. See Category Codes Glossary for definition of all abbreviations.
2. See Glossary for definitions of abbreviations.
3. Station Set Zero is used for wastes from the space shuttle launches which are generated at a place other than a designated station set (e.g., SCAPE suit cleaning facility).
4. NL = not listed.
5. Primol 355 is a high-viscosity mineral oil. Usage requires a design decision and Air Force approval. Either Primol 355, another oil, or a foam will be used to prevent vaporization of spilled hypergols.
6. This waste could be off-loaded either at Station Set V19 or V21. Station Set V19 has been arbitrarily chosen.
7. This contingency could occur either at Station Set V23 or V31. Station Set V23 has been arbitrarily chosen.
8. Insulation is mixed, but not used.
9. Insulation is unmixed, but with shelf life exceeded.
10. Nature of contaminants not determined.
11. Contains unidentified surfactants and/or detergents.
12. Solvents include Freon TMC, trichloroethane, methyl ethyl ketone, and cellosolve (4).

TOTAL											

1. Volume of solids and liquids is expressed in liters to maintain consistency in table format. Divide liters by 1,000 to obtain cubic meters of solids.
2. Station Set Zero is used for wastes from the space shuttle launches which are generated at a place other than a designated station set (e.g., SCAPE suit cleaning facility).
3. This assumes that cleaning the SCAPE suits will require approximately 2 gallons (7.6 liters) of freon per SCAPE suit.
4. Baseline amounts are based on the assumption that each SCAPE suit at a given station set is pre-rinsed with EEW&S water for 10 minutes at a rate of 4 gallons (15 liters) per minute once every launch cycle (20).
5. Waste is not generated every launch cycle. Amount per launch used to calculate amount per year represents an average for multiple launch cycles.
6. Paint cans are assumed to weigh 7.5 pounds per cubic foot (120 kg/m^3), or 1 pound per gallon can.
7. Spray cans are assumed to weigh 6 pounds per cubic foot (95 kg/m^3).
8. Cups and wood sticks are assumed to weigh 3 pounds per cubic foot (48 kg/m^3).
9. Contaminated rags are assumed to weigh 5 pounds per cubic foot (80 kg/m^3).
10. Contaminated clothes, cloth, and debris are assumed to weigh 2 pounds per cubic foot (32 kg/m^3).
11. Primol 355 is a high-viscosity mineral oil. Usage requires a design decision and Air Force approval. Either Primol 355, another oil, or a foam will be used to prevent vaporization of spilled hypergols.
12. Contingency is a once-around abort. It is assumed that once every 2 years, independent of the number of launches, one before-launch abort and one once-around abort will occur. Values reported on a per year basis represent half the waste from an abort.
13. Density of Instant Set Polymer scraps is assumed to be 5 pounds per cubic foot (79 kg/m^3).
14. This waste could be off-loaded either at Station Set V19 or V21. Station Set V19 has been arbitrarily chosen.
15. The operation generating this waste occurs once every 5 launches. The unit factor per launch used to calculate annual quantities equals the total amount of waste generated per operation divided by 5.
16. Paint brushes are assumed to weigh 8 pounds per cubic foot (128 kg/m^3).

17. This assumes a density of 0.8 g/ml (6.7 lb/gal).
18. This assumes the density of water (1.0 g/ml; 8.3 lb/gal).
19. This assumes that the acquisition screen test which produces the wastes occurs an average of once every three launch cycles.
20. This assumes that one payload bay kit is spilled per year, independent of the number of launches.
21. Contaminated filters are assumed to weigh 1 pound per cubic foot (16 kg/m³).
22. Contingency is a before-launch abort. It is assumed that once every 2 years, independent of the number of launches, one before-launch abort and one once-around abort will occur (15). Values reported on a per year basis represent half the waste from an abort.
23. This contingency could occur either at Station Set V23 or V31. Station Set V23 has been arbitrarily chosen.
24. This contingency assumes one SRB per year is damaged and releases propellant, independent of the number of launches. Contingency amounts for an SRB propellant spill are not included in the total contingency amounts for the station set and for all wastes combined. Should this unlikely event occur, it is assumed that the propellant will spontaneously ignite and burn.
25. Volume given is amount based on number of 55-gallon drums required to hold the waste.
26. This assumes a density of 1.4 g/ml (11.7 lb/gal), based on the average density of solvents commonly used for STS operations.
27. This assumes that 10 percent of total amount used becomes waste (4).
28. Containers and packing materials are assumed to weigh 0.3 pounds per cubic feet.
29. Insulation is mixed, but not used.
30. Insulation is unmixed, but with the shelf life exceeded.
31. This assumes wastewater is 5 percent alodine by weight.
32. Nature of contaminants not determined.

- 33. This assumes that all insulations are removed with equal efficiency. Quantities ignore loss of material due to burnoff.
- 34. This assumes a density of 4 pounds per cubic foot (64 kg/m^3).
- 35. Contains unidentified surfactants and/or detergents.
- 36. Solvents include Freon TMC, trichloroethane, methyl ethyl ketone, and cellosolve (4).
- 37. Density of pour foam is assumed to be 2.8 pounds per cubic foot (45 kg/m^3).
- 38. Density of ablator is assumed to be 0.67 pounds per cubic foot (10.6 kg/m^3).

SECTION 5

SUMMARY OF HAZARDOUS WASTE GENERATION

1. INTRODUCTION

The space shuttle program at Vandenberg Air Force Base is expected to generate a variety of hazardous wastes during its years of operation, from 1985 to 1994. The purpose of this report is to present an inventory of the expected types and quantities of waste to be generated by shuttle-related ground operations. The inventory provides estimates for:

- Types of wastes generated.
- Chemical constituents in each waste stream.
- Mass and/or volume of waste generated during scheduled ground operations (per launch cycle, per month per year, and project total).
- Mass and/or volume of waste generated under contingency conditions (per contingency event, per year, and project total).
- EPA and California hazardous waste numbers for each waste.
- EPA and California hazardous properties for each waste.
- California compatibility class for each waste.

The inventory will be used to assess waste management options (Volume II of this report), to complete EPA hazardous waste forms, and for preparing the supplement to the Environmental Impact Statement required for the Space Transportation System (STS) project.

2. SOURCES OF WASTE

A summary of the hazardous wastes generated over the duration of the STS project at VAFB is given in Tables 14, 15, and 16; monthly, yearly, and total project quantities are reported, respectively, for normal operations and contingency conditions.

TOTAL	121,367.7	267,571.5	124,633.5	131,165.2	274,771.5	289,171.5	139,329.6	139,329.6	307,171.5	307,171.5	1,352,475.0	1,352,475.0	2,981,715.0	2,981,715.0

As shown in Table 15, total baseline waste generation for the STS project is anticipated to be 130 million kg (287 million lbs). Annual waste generation is estimated to range from 4.2 million kg/yr (9.2 million lbs/yr) for 1985, to 15.6 million kg/yr (34.5 million lbs/yr) for each of the years 1988 through 1994. This increase reflects changes in the number of launches per year from 4 to 15. Baseline waste generation for each year of the project is graphically represented in Figure 10.

The greatest quantities of wastes are expected to be generated by V23 (72 million kg; 160 million lbs for total project), followed by Station Set V32 (54 million kg; 120 million lbs for total project). This accounts for 97.5 percent by weight of all baseline hazardous waste generation. The combined waste generated by all other Station Sets is projected to be 2.5 orders of magnitude less by weight than waste generation at V23 and V32.

Expressed as percentages by weight (Figure 11), Station Set V23 is projected to generate 55.7 percent of the total under normal operating conditions; V32 approximately 41.8 percent; and V19 and V31, less than 1 percent each. The balance of these wastes (i.e., 0.9 percent) will be generated mainly by Station Sets V17 and V21.

According to Table 16, estimated total project waste generated under contingency conditions is 1.4 million kg (3.0 million lbs). The only station sets identified to date as potential generators of contingency wastes are V19, V21, and V23 (Figure 12). Station set V23 will produce approximately 84 percent by weight of all contingency waste.

Investigations into the physical state of the hazardous wastes generated during normal operations indicate that the majority of wastes are in a liquid state (Figure 13a). Major sources of liquid hazardous wastes, as shown in Figure 13c, are expected to be produced during normal ground operations at Station Sets V23 (55.9 percent) and V32 (41.9 percent). Other station sets each produce less than 1 percent of total liquid wastes. In summary, 99.6 percent by weight (1.0 million kg; 2.3 million lbs) of all the hazardous wastes will be in a liquid form (Figure 13a). This translates to 92.7 percent on a volumetric basis.

Only 0.4 percent by weight (7.3 percent by volume) of all hazardous wastes are expected to be in a solid state (Figure 13a). Most solid waste will be produced by Station Set V31 (71.5 percent) and Station Set V32 (19.1 percent) as shown in Figure 13b. Solid waste generation by all other station sets is less than 10 percent of total solids.

Figure 10. Baseline quantities of hazardous waste generated by STS ground operations at VAFB (reported for each year for the period 1985 through 1994).

Figure 11. Baseline quantities of hazardous waste generated by STS ground operations at VAFB (reported by station set).

Figure 12. Contingency waste generated by STS ground operations at VAFB (Station Sets V19, V21, and V23).

Figure 13. Physical state of hazardous waste generated by STS ground operations at VAFB under baseline conditions (reported by station set).

3. MAJOR TYPES OF WASTES GENERATED

Waste categories generated in the largest quantities are expected to be:

- Quench water (QW).
- SRB wash water (SB).
- Insulation wastewater (or "suprawater") (IW).
- SRB initial rinse (SI).
- Contaminated seawater (CS).
- Nonaqueous solvent wastes (SO).
- EEW&S wastewater (EW).
- Fuel spill cleanup wastes (FS).
- Hydrazine scrubber effluent (HS).

These wastes are estimated to constitute 99.4 percent by weight of total waste generation (129 million kg; 284 million lbs). The QW is projected to be the most predominant waste type, followed by SB and IW wastes. As shown in Figure 14a, these three waste types constitute 54.6, 20.4, and 17.8 percent by weight, respectively, of the total quantity of wastes generated by the major waste categories. Other major waste categories produce 7.2 percent of the total waste. The remaining 0.6 percent of waste is associated with the following minor categories (Figure 14b):

- Adhesive wastes (AW).
- Batteries (BA).
- Contaminated air filters (CA).
- Catalytic bed wash water (CB).
- Containers (CN).
- Contaminated rags (CR).
- Hydraulic fluids (HF).
- Hydrazine (HY).
- Insulation wastes, solid (IN).
- Monomethyl hydrazine (MH).
- Ammonia or ammonia wastewater (NH).
- Nitrogen tetroxide (NO).
- Oxidizer spill cleanup (OS).
- Paint wastes (PA).
- Paint wastewaters (PW).
- Solvent reducer wastes (SR).
- Solvent wastewaters (SW).
- Worn-out parts (WP).

The first three minor categories are expected to jointly contribute over 60 percent by weight to the 0.6 percent of minor wastes.

4. HAZARDOUS AND ACUTELY HAZARDOUS WASTES

Further breakdown of wastes into hazardous and acutely hazardous categories reveals that only 1.8 percent by weight of total hazardous wastes are expected to exhibit acutely hazardous properties (Figure 15a). Primary generators of acutely hazardous

Figure 14. Hazardous waste generated under baseline conditions, by waste type.

A) PERCENT OF HAZARDOUS AND ACUTELY HAZARDOUS WASTES

B) ACUTELY HAZARDOUS WASTES BY STATION SET

Figure 15. Hazardous and acutely hazardous waste generation under baseline conditions.

waste will be Station Sets V19 (37.0 percent), V23 (25.8 percent), V21 (18.2 percent), and V17 (14.9 percent) (Figure 15b). The remaining 4.1 percent is expected to be generated by Station Sets V31 and V32 (3.3 and 0.8 percent, respectively) (Figure 15b). As shown in Figure 16, most of the hazardous wastes generated by Station Sets V17, V19 and V21 are expected to exhibit acutely hazardous properties.

Generation rates for hazardous and acutely hazardous wastes are provided in Tables 17 and 18. Total projected baseline quantities of hazardous and acutely hazardous waste per launch are 1.0 million kg (2.2 million lb) and 0.02 million kg (0.04 million lb), respectively (Table 14). Consequently, the projected cumulative generation of these wastes for the period 1985 through 1994 is expected to be 128 million kg (282 million lb) and 2.3 million kg (5.1 million lb), respectively (Table 18).

Figure 16. Comparison of hazardous and acutely hazardous waste generation under baseline conditions (reported by station set on a per launch basis).

APPENDIX A

HAZARDOUS WASTE GENERATION BY STS
GROUND OPERATIONS AT VAFB, LISTED
BY EPA HAZARDOUS WASTE NUMBER

APPENDIX A

The following tables were compiled to assist VAFB personnel in completing all pertinent EPA notification and application forms. Both tables are organized by EPA hazardous waste number, in much the same fashion as required by the Hazardous Waste Permit Application Form 3510-3. Estimated annual hazardous waste quantities are presented for each waste. These quantities are based on the numerical data available at the time that the information was developed. Those hazardous waste numbers described as "included with above" are components of the quantified waste number above; as components, they do not need to be quantified separately if the total mixed waste is quantified. Table A-1 further divides the wastes by station set. Table A-2 presents the hazardous waste numbers and annual quantities for the project as a whole.

TABLE A-1. EPA DESCRIPTION OF HAZARDOUS WASTE
(by Station Set)

Station Set	EPA Hazardous Waste No.	Quantity per Launch	Estimated Annual Quantity (kg)				Project Total
			1985	1986	1987	1988-1994 (per year)

GLOSSARY

ADDI	Additives
AFB	Air Force Base
Ag	Silver
Al	Aluminum
APPL	Application
APS	Aft propulsion system
APU	Auxiliary power unit
ARCS	Aft reaction control subsystem
AUX	Auxiliary
BGE	Butyl glycidyl ether
C	Corrosive
CAT	Category
CC	Cubic centimeters
CF	Cubic feet
CFM	Cubic feet per minute
CLNP	Cleanup
CM	Centimeters
CMP	Corrugated metal pipe
CMPNTS	Components
CO ₂	Carbon dioxide
COMP	Compatibility
Cr	Chromium
Cu	Copper
CY	Cubic yards
DOT	Department of Transportation
E	EP toxic
EEW&S	Emergency eyewash and shower
EIS	Environmental Impact Statement
EPA	Environmental Protection Agency
ET	External tank
F	Flammable
FRCS	Forward reaction control system
Ft ²	Square feet

GLOSSARY (continued)

Ft ³	Cubic feet
FWD	Forward
Gal	Gallons
GH ₂	Gaseous hydrogen
GHe	Gaseous helium
GN ₂	Gaseous nitrogen
GO ₂	Gaseous oxygen
GPM	Gallons per minute
H	EPA acutely hazardous
H ₂ O	Water
H ₂ O ₂	Peroxide
Ha	Hectares
He	Helium
HP	Horsepower
HYD	Hydrazine
Hz	Hertz
i	Ignitable
I	Irritant
IPA	Isopropyl alcohol
ISP	Instant set polymer
IW	Insulation wastewater (suprawater)
KSC	Kennedy Space Center
kV	Kilovolts
kVA	Kilovoltampere
kW	Kilowatt
L	Liters
LAPS	Left aft propulsion system
LBM	Liquid boost module
Lbs	Pounds
LH ₂	Liquid hydrogen
LIQ	Liquid
LN ₂	Liquid nitrogen
LO ₂	Liquid oxygen

GLOSSARY (continued)

LP	Launch pad
M	Meter
M ²	Square meters
M ³	Cubic meters
MDA	Methylene dianiline
MDI	Diphenyl methane diisocyanate
MECl	Methylene chloride
MEK	Methyl ethyl ketone
Mg	Magnesium
MMH	Monomethylhydrazine
mPDA	meta-Phenylene diamine
MSA	Marshall Sprayable Ablative
MTA	Marshall Trowlable Ablative
N/A	Not applicable
N ₂	Nitrogen
N ₂ H ₄	Anhydrous hydrazine
N ₂ O ₄	Nitrogen tetroxide
NaOH	Sodium hydroxide
ND	No data
Neg	Negligible
NH ₃	Ammonia
NVAFB	North Vandenberg Air Force Base
O&M	Operation and Maintenance
O ₂	Oxygen
OPNS	Operations
ORB	Orbiter
ORD	Ordnance
OXID	Oxidizer
P	Pressure generating
Pb	Lead
PBK	Payload bay kit
PCB	Polychlorinated biphenyl
PCR	Payload changeout room

GLOSSARY (continued)

PERC	Perchloroethylene
PH	Port Hueneme
POTW	Publicly owned treatment works
PPM	Parts per million
PPR	Payload preparation room
PRG	Purge
PRO1	Protective or protection
PSI	Pounds per square inch
PVC	Polyvinylchloride
QW	Quench water
R	Reactive
RAPS	Right aft propulsion system
RCRA	Resource Conservation and Recovery Act
RSV	Remote service vehicle
RTN	Routine
RV	Retrieval vessel
S	Strong sensitizer
S&A	Safe and arm
SCAPE	Self-contained atmospheric protective ensemble
SEG	Segment
SF	Square feet
SKT	Skirt
SOFI	Spray-on foam insulation
SOL	Solid
SPL	Spill(s)
SRB	Solid rocket booster
SRM	Solid rocket motor
SS	Station set
SSS	Station set specification
STA	Station
STS	Space transportation system
SVAFB	South Vandenberg Air Force Base
T	Toxic

GLOSSARY (continued)

TCE	1,1,1-trichloroethane
TP	Thrust post
TPH	Tons per hour
TPS	Thermal Protection System
TRT	Treatment
TVC	Thrust vector control
UDMH	Unsymmetrical dimethylhydrazine
VAFB	Vandenberg Air Force Base
Zn	Zinc

CATEGORY CODES

AL	Alkaline cleaning solutions
AW	Adhesive wastes, nonaqueous
BA	Batteries
BW	Bilge wastes
CA	Contaminated air filters
CB	Catalytic bed wash water
CC	Contaminated clothing
CN	Containers
CR	Contaminated rags
CS	Contaminated seawater
CW	Forward skirt cleaning wastes
EW	EEW&S wastewater
FO	Fuel, oil and grease spills and wastes
FS	Fuel spill cleanup
HF	Hydraulic fluids
HS	Hydrazine scrubber effluent
HY	Hydrazine
IN	Insulation wastes, solid
IW	Insulation wastewater (suprawater)
MH	Monomethylhydrazine
NH	Ammonia (NH_3), or water with ammonia
NO	Nitrogen tetroxide (N_2O_4)
OR	Ordnance
OS	Oxidizer spill cleanup
PA	Paint wastes, nonaqueous
PR	Preservative wastes, nonaqueous

CATEGORY CODES (continued)

PS	Propellants, solid
PW	Painting wastewater
QW	Quench water
SB	SRB wash water
SI	SRB initial rinse
SO	Solvent wastes, nonaqueous
SR	Solvent reducer wastes
SW	Solvent wastewater
WP	Worn-out parts
WS	Wastewater treatment sludges
